To me, this patch release is more about fixing some bugs, rather than introducing new features. . What is the benefit? There's no mention of it in the README file in the github version, nor the wiki entry. . But I think the idea is that the developer can put in a fix to whatever bugs are occurring and then it will be pushed out in the release. . What can you do with it? . It's not a new beta or a new test. . That sounds like it's just for fixing bugs, not introducing new features. . True, it doesn't appear to be introducing new features, but to me, that means the patch is more about fixing bugs, rather than introducing new features. Do you think the 1.08 release will introduce more new features, or is it just about fixing bugs? A: The patch releases, particularly between versions 1.07 and 1.08, are usually introduced with more features, e.g. content that you can download for use in your game. *Eragrostis rupestris* *Eragrostis rupestris* is a species of grass known by the common names Chilean love grass and Chilean nasturtium. It is native to southern South America, where it is common in tropical and subtropical regions. It grows in a variety of habitats, including dry places such as deserts. It is an annual grass growing to about 25 centimeters tall. The inflorescence is an array of spikelets. The spikelets are one millimeter long and about half a millimeter wide.
